Legacy Park Event Website

2021

Table of Contents

1. Introduction
 - 1.1. Environment
2. User Description
 - 2.1. Homepage
 - 2.2. Forms
 - 2.3. Contact
 - 2.4. About
 - 2.5. Past Events
3. Continuous Deployment

1 Introduction

The Legacy Park Event Page is a website designed for the annual artists' event organized by Isabel Kienzle. While most of the website will be developed through WordPress, the goal is to allow continuous deployments for future builds.

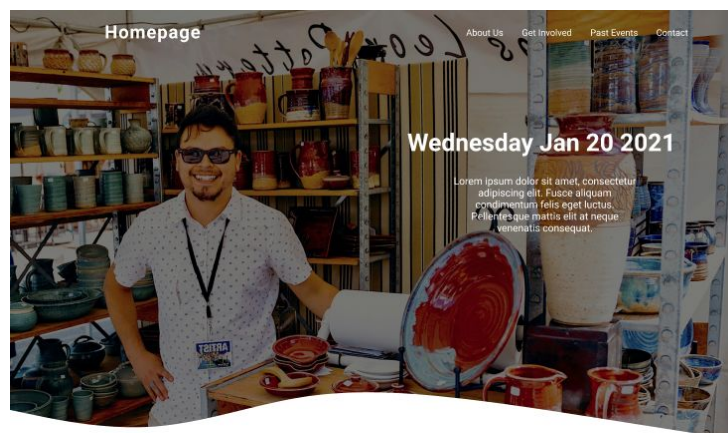

1.1 Environment

The goal right now is to support all cloud providers to host the website. This is to provide the organizer the flexibility to choose her platform later on.

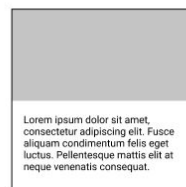

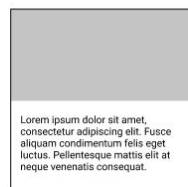

2 Website Overview

2.1 Homepage

The homepage is the main landing page that gives thorough information about the event to someone who is interested in attending or participating. It should display the list of artists, the event location, and the list of vendors.

Activities

2.2 Forms

Three different forms (Artist, Vendor, Volunteers) should be available from the “Get Involved” drop-down menu that navigate to three separate pages. The Artist form should include submission fields for name, contact information, social media, resume, bio, and file attachments (5 max). Vendors form should include their website and contact information. Volunteers form includes contact information, address, phone number, and possible preferences.

Artist Form

Email:

Contact Information:

Social Media Handle:

Short Bio:

2.3 Contact

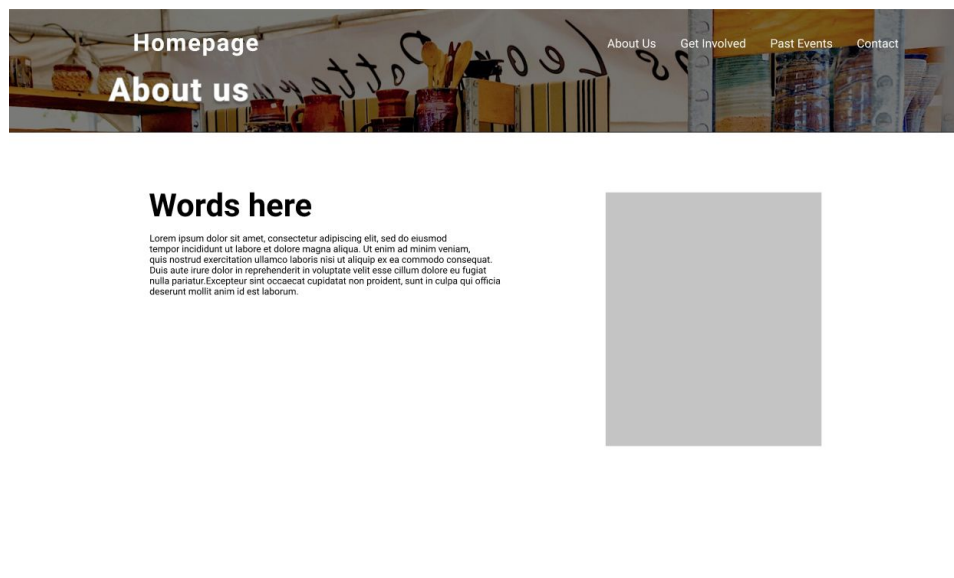

The contact page should provide fields (name, email, message) for interested people to contact the organizer directly from the website. It also links the organizer’s phone number, email, and social media (if any).

Name	Email	Contact Info Phone number here Email here Social media here
Message		

2.4 About

Writings about how the event started, the history, etc. Include information about the founder and organizer, Isabel.

2.5 Past Events

Displays the list of older events (since this is annual). If clicked, more details should be given about those events.

3 Continuous Deployment

Three different servers will be used for the deployment process. We need to figure out a way to automate this process that pushes the theme from GitHub and eventually clone to the other servers.

3.1 *Development*

The development takes place here. Ideal for receiving feedback from the organizer.

3.2 *Staging*

The staging server will be used for testing and review before pushing to production.

3.3 *Production*

The actual server that hosts the website for the users.
